Cross-Site Scripting is one of the most known web vulnerability. It is highly referenced in any technical discussion, and relatively understood. However, many security specialists as well as others don't fully understand how easy it is to leverage these vulnerabilities and bypass common security mechanisms such as two factor authentication, CAPTCHA, etc. In this presentation we will cover Same Origin Policy, and show how severe Cross-Site Scripting vulnerabilities really are.

Adi Sharabani is in charge of the security strategy to improve the security of all IBM Rational products. As part of his role, Adi is responsible for leading, designing and deploying overall security processes within the global development groups. Previous to his current role, Adi used to head the IBM Rational Application Security Research, responsible for product and industry research activities that pertain to Web application security.
